

NYSSMA 2021 Winter Conference

Rochester, New York

**Focus to The Future: 5G Meets MIDI 2,
and Aloha. **

**Connectivity Data-system Advancements for Reduced Latency
Performance Opportunities!**

**Friday, Dec 3rd
8:15 AM - 9:15 AM
Dr. Fred Kersten
fredkers@fredkersten.com
<http://fredkersten.com>**

Presentation Website Online at:

Abstract

This presentation will describe and demonstrate new developments in music technology that are presently being implemented and will directly influence teaching and performance in the near future. MIDI 2.0, 5G, and Aloha ElkLIVE will be considered. Each of these tools is in development/implementation stages and presently appearing on the market.

*MIDI 2.0 is an update of MIDI 1.0 language and accepts bidirectional communications between various controllers and synthesizers. To the present day, MIDI 1.0 has limitations, permitting only asynchronous communications between devices. The new language included in MIDI 2.0 will provide more channels (past MIDI 1-16 channel protocol) and better resolution (overall resolution of MIDI 2.0 from MIDI 1 will update from 128 steps at seven bits of data to 4 billion steps at 32 bits).

*5G will provide extensive data transfer at unbelievable speeds up to 10 times faster than present data networks. Musicians will be able to perform synchronously over vast distances almost instantaneously with low-latency communications.

*ElkLIVE. previously Aloha (a beta-level interface, which allows for low-latency synchronous music interaction), is a hardware/digital protocol that provides instant performance connectivity. ElkLIVE has just now joined the commercial market. It illustrates the advancing future for low-latency sharing between individuals through distance performance.

Examples of utilization, and consideration of specific devices in present experimental usage will be provided for attendees. A dedicated webpage and detailed handout for further assistance will be developed for this presentation and remain available for referral after the session has been presented.

Presentation Outline

Exciting new developments for sophisticated music data sharing are presently occurring. Upgraded MIDI 2.0 (Bidirectional dialogue); 5G (blazing speed--many bright prospects through currently developing networks); and ElkLIVE (low-latency, synchronous performance) are all on the horizon. This presentation will: a. explore all three, b. provide important specifics for understanding, and c. illustrate the sophistication/advantages of these music technology tools for teachers/students as better learning and musical creation take place. Examples will be provided and supported with video descriptions.

Descriptions will be provided for the following:

5G

- *Synchronized Reality
- *Virtual performances—Concerts, Classes, Live Shows Streamed to Large Groups
- *Group Ensemble Rehearsals (Worldwide)
- *Universal Band, Orchestra, Choral Ensembles
- *Transfer Speed Demographics
- *Latency*Setup and Implementation

- *Limitations, Development Problems
- *Musical Importance to the Professor/Student

MIDI 2.0

- * MIDI Capability Inquiry (MIDI-CI):
 - a. Profile Configuration
 - b. Property Exchange
 - c. Protocol Negotiation
- *Bidirectional dialogue--synchronous devices talk to each other--Mixer to Synthesizers
- *High Resolution Availability
- *New Musical Expressive Controllers--32-High-Resolution Velocity
- *Futuristic Construction Specifications
- *Hardware/Software Communication
- *USB Internet Connections
- *Ample Space for Expansion

ElkLIVE

- *Presently in Use (Operationalized--June, 2021)
- *Current—in market sales and promotion
- *Connectivity Hardware and Internet Requirements
- *Elk Audio OS-its Value and Current Status
- *Audio Latency:1 ms-Signal Sent Audio; 1 ms Signal-Received Audio
- *Live Share: Jazz Ensemble Jams, Choral/Instrumental Rehearsals
- *Collaboration Sync Opportunities: (Lessons, Performances, Ensemble Development)

DWDM-Dense Wavelength Division Multiplexing

(DWDM) is a mature and well-established technology capable of improving fiber efficiency by multiplexing multiple wavelengths over a single fiber.

Traditional transmission foresees that each optical signal (grey optic) is transported via a fiber pair

DWDM leverages on colored optics: signals have different color can be multiplexed over a single fiber strand

About The Presenter

Dr. Fred Kersten:

Fred Kersten is currently and has been for twelve years an Online Graduate Facilitator for Boston University. He works with graduate music education majors around the world who are completing their masters and doctorate degrees in music education. Currently he is instructor in charge of online music technology courses taught.

A veteran of public-school music teaching in Choral, General and Instrumental areas, Fred has taught music from Nursery, and Kindergarten through Graduate Levels. His doctoral dissertation focused on Music for the Visually Impaired and was developed from his many years of teaching music to students with exceptionalities. Interest in the recorder as a performing instrument led to study at Indiana University and he authored a book on Teaching Recorder that has been published by NAFME. His performance repertoire includes Bach, Handel, Telemann, and the vast repertoire of classical recorder literature. His current interests are focused on music technology and his study of classical pipe organ, which was his dual major as an undergraduate in addition to clarinet and recorder.
